#### **INFORMS** Annual Meeting

Houston — 22-25 October 2017 — Session TB74 INFORMS Computing Society

# 4 Ways to Use an Optimization Modeling Language

#### Command language

- Browse results & debug model interactively
- Make changes and re-run

### Scripting language

Write programs using modeling language constructs

### **Programming interface (API)**

 Embed a modeling language and system within a general-purpose programming language

### Application-building toolkit

 Use a application-building system designed specifically for the modeling language

#### Features

- Algebraic modeling language
- Built specially for optimization
- Designed to support many solvers

#### APIs

- \* C++, C#, Java, MATLAB, **Python**
- ✤ R coming soon

### Application-building toolkit

\* **QuanDec** / built on Java API

## Example

#### Roll cutting in Python API

- Solution by pattern enumeration
- Solution by pattern generation
- Tradeoff between waste and overruns

#### QuanDec

Overview

## **Roll Cutting Problem**

#### **Motivation**

- Fill orders for rolls of various widths
  - \* by cutting raw rolls of one (large) fixed width
  - \* using a variety of cutting patterns

#### **Optimization** model

- Decision variables
  - \* number of raw rolls to cut according to each pattern
- Objective

\* minimize number of raw rolls used

- Constraints
  - \* meet demands for each ordered width

# Roll cutting Mathematical Formulation

#### Given

- *w* width of "raw" rolls
- *W* set of (smaller) ordered widths
- *n* number of cutting patterns considered

and

- $a_{ij}$  occurrences of width *i* in pattern *j*, for each  $i \in W$  and j = 1, ..., n
- $b_i$  orders for width i, for each  $i \in W$
- *o* limit on overruns

# Roll cutting **Mathematical Formulation** (cont'd)

#### Determine

 $X_j$  number of rolls to cut using pattern *j*, for each j = 1, ..., n

to minimize

 $\sum_{j=1}^{n} X_{j}$ 

total number of rolls cut

subject to

 $b_i \leq \sum_{j=1}^n a_{ij} X_j \leq b_i + o$ , for all  $i \in W$ 

number of rolls of width *i* cut must be at least the number ordered, and must be within the overrun limit

# Roll cutting **AMPL Formulation**

#### Symbolic model

```
param rawWidth;
set WIDTHS;
param nPatterns integer > 0;
set PATTERNS = 1..nPatterns;
param rolls {WIDTHS,PATTERNS} >= 0, default 0;
param order {WIDTHS} >= 0;
param overrun;
var Cut {PATTERNS} integer >= 0;
minimize TotalRawRolls: sum {p in PATTERNS} Cut[p];
subject to FinishedRollLimits {w in WIDTHS}:
    order[w] <= sum {p in PATTERNS} rolls[w,p] * Cut[p] <= order[w] + overrun;</pre>
```

 $b_i \le \sum_{i=1}^n a_{ii} X_i \le b_i + o$ 

# Roll Cutting **AMPL Formulation** (cont'd)

Explicit data (independent of model)

```
param rawWidth := 64.5 ;
param: WIDTHS: order :=
    6.77    10
    7.56    40
    17.46    33
    18.76    10 ;
param nPatterns := 9 ;
param rolls: 1  2  3  4  5  6  7  8  9 :=
    6.77  0  1  1  0  3  2  0  1  4
    7.56  1  0  2  1  1  4  6  5  2
    17.46  0  1  0  2  1  0  1  1  1
    18.76  3  2  2  1  1  1  0  0  0;
param overrun := 6 ;
```

# Roll Cutting AMPL Command Language

*Model* + *data* = *problem instance to be solved* 

```
ampl: model cut.mod;
ampl: data cut.dat;

### **Cutting via Pattern Enumeration**

#### Build the pattern list, then solve

- Read general model
- Read data
  - \* demands, raw width
  - \* orders, overrun limit
- Compute data: all "good" patterns
  - \* extract widths from demand list
  - \* enumerate all non-dominated patterns
- Solve problem instance

#### Pattern Enumeration

## **Example Using the AMPL API**

#### Hybrid approach

- Control & pattern enumeration in Python
- Model & modeling expressions in AMPL

### Key to program examples

- AMPL entities
- AMPL API Python objects
- AMPL API Python methods
- Python functions etc.

#### AMPL API AMPL Model File

Same pattern-cutting model

#### AMPL API Some Python Data

A float, an integer, and a dictionary

```
roll_width = 64.5
overrun = 6
Orders = {
    6.77: 10,
    7.56: 40,
    17.46: 33,
    18.76: 10
}
```

... can also work with lists and Pandas dataframes

#### Load & generate data, set up AMPL model

```
def cuttingEnum(dataset):
    from amplpy import AMPL

    # Read orders, roll_width, overrun
    exec(open(dataset+'.py').read(), globals())

    # Enumerate patterns
    widths = list(sorted(orders.keys(), reverse=True))
    patmat = patternEnum(roll_width, widths)

    # Set up model
    ampl = AMPL()
    ampl.option['ampl_include'] = 'models'
    ampl.read('cut.mod')
```

#### Send data to AMPL

```
# Send scalar values
ampl.param['nPatterns'] = len(patmat)
ampl.param['overrun'] = overrun
ampl.param['rawWidth'] = roll_width
```

```
# Send order vector
ampl.set['WIDTHS'] = widths
ampl.param['order'] = orders
```

```
# Send pattern matrix
ampl.param['rolls'] = {
   (widths[i], 1+p): patmat[p][i]
   for i in range(len(widths))
   for p in range(len(patmat))
}
```

#### Solve and get results

```
# Solve
ampl.option['solver'] = 'gurobi'
ampl.solve()
# Retrieve solution
CuttingPlan = ampl.var['Cut'].getValues()
cutvec = list(CuttingPlan.getColumn('Cut.val'))
```

#### Display solution

```
# Prepare solution data
summary = \{
    'Data': dataset,
    'Obj': int(ampl.obj['TotalRawRolls'].value()),
    'Waste': ampl.getValue(
                 'sum {p in PATTERNS} Cut[p] * \
                     (rawWidth - sum {w in WIDTHS} w*rolls[w,p])'
             )
}
solution = [
    (patmat[p], cutvec[p])
    for p in range(len(patmat))
    if cutvec[p] > 0
٦
# Create plot of solution
cuttingPlot(roll_width, widths, summary, solution)
```

#### Enumeration routine

```
def patternEnum(roll_width, widths, prefix=[]):
  from math import floor
  max_rep = int(floor(roll_width/widths[0]))
  if len(widths) == 1:
    patmat = [prefix+[max_rep]]
  else:
    patmat = []
    for n in reversed(range(max_rep+1)):
        patmat += patternEnum(roll_width-n*widths[0], widths[1:], prefix+[n])
    return patmat
```

#### Plotting routine

```
def cuttingPlot(roll_width, widths, summ, solution):
    import numpy as np
    import matplotlib.pyplot as plt
    ind = np.arange(len(solution))
    acc = [0]*len(solution)
    colorlist = ['red','lightblue','orange','lightgreen',
                          'brown','fuchsia','silver','goldenrod']
```

Plotting routine (cont'd)

```
for p, (patt, rep) in enumerate(solution):
   for i in range(len(widths)):
      for j in range(patt[i]):
         vec = [0]*len(solution)
         vec[p] = widths[i]
         plt.barh(ind, vec, 0.6, acc,
                   color=colorlist[i%len(colorlist)], edgecolor='black')
         acc[p] += widths[i]
plt.title(summ['Data'] + ": " +
   str(summ['Obj']) + " rolls" + ", " +
   str(round(100*summ['Waste']/(roll_width*summ['Obj']),2)) + "% waste"
plt.xlim(0, roll_width)
plt.xticks(np.arange(0, roll_width, 10))
plt.yticks(ind, tuple("x {:}".format(rep) for patt, rep in solution))
plt.show()
```

INFORMS Annual Meeting, Houston, 22-25 October 2017

### **Cutting via Pattern Generation**

#### Generate the pattern list by a series of solves

- Solve continuous relaxation using subset of "easy" patterns
- Add "most promising" pattern to the subset
  - \* Minimize reduced cost given dual values
  - \* Equivalent to a one-constraint ("knapsack") problem
- Iterate as long as there are promising patterns
  - \* Stop when minimum reduced cost is zero
- Solve IP using all patterns found

# Pattern Generation Example Using the API

#### Two AMPL objects

- Master is the cutting model with current pattern subset
- Sub is the one-constraint knapsack problem

### Key to program examples

- AMPL entities
- AMPL API Python objects
- AMPL API Python methods
- Python functions etc.

#### Get data, set up master problem

```
function cuttingGen(dataset)
  from amplpy import AMPL
  # Read orders, roll_width, overrun; extract widths
  exec(open(dataset+'.py').read(), globals())
  widths = list(sorted(orders.keys(), reverse=True))
  # Set up cutting (master problem) model
  Master = AMPL()
  Master.option['ampl_include'] = 'models'
  Master.read('cut.mod')
  # Define a param for sending new patterns
  Master.eval('param newPat {WIDTHS} integer >= 0;')
  # Set solve options
  Master.option['solver'] = 'gurobi'
  Master.option['relax_integrality'] = 1
```

#### Send data to master problem

```
# Send scalar values
Master.param['nPatterns'] = len(widths)
Master.param['overrun'] = overrun
Master.param['rawWidth'] = roll_width
# Send order vector
Master.set['WIDTHS'] = widths
Master.param['order'] = orders
# Generate and send initial pattern matrix
Master.param['rolls'] = {
  (widths[i], 1+i): int(floor(roll_width/widths[i]))
    for i in range(len(widths))
  }
```

#### Set up subproblem

```
# Define knapsack subproblem
Sub = AMPL()
Sub.option['solver'] = 'gurobi'
Sub.eval('''
set SIZES;
param cap >= 0;
param val {SIZES};
var Qty {SIZES} integer >= 0;
maximize TotVal: sum {s in SIZES} val[s] * Qty[s];
subject to Cap: sum {s in SIZES} s * Qty[s] <= cap;
''')
# Send subproblem data
Sub.set['SIZES'] = widths
Sub.param['cap'] = roll_width
```

Generate patterns and re-solve cutting problems

```
# Alternate between master and sub solves
while True:
    Master.solve()
    Sub.param['val'].setValues(Master.con['OrderLimits'].getValues())
    Sub.solve()
    if Sub.obj['TotVal'].value() <= 1.00001:</pre>
       break
    Master.param['newPat'].setValues(Sub.var['Qty'].getValues())
    Master.eval('let nPatterns := nPatterns + 1;')
    Master.eval('let {w in WIDTHS} rolls[w, nPatterns] := newPat[w];')
# Compute integer solution
Master.option['relax_integrality'] = 0
Master.solve()
```

#### Display solution

```
# Retrieve solution
cutting_plan = Master.var['Cut'].getValues()
cutvec = list(cutting_plan.getColumn('Cut.val'))
# Prepare summary data
summary = \{
      'Data': dataset.
      'Obj': int(Master.obj['TotalRawRolls'].value()),
      'Waste': Master.getValue(
               'sum {p in PATTERNS} Cut[p] * \
                  (rawWidth - sum {w in WIDTHS} w*rolls[w,p])'
}
# Retrieve patterns and solution
npatterns = int(Master.param['nPatterns'].value())
rolls = Master.param['rolls'].getValues().toDict()
cutvec = Master.var['Cut'].getValues().toDict()
```

#### Display solution

```
# Prepare solution data
solution = [
  ([int(rolls[widths[i], p+1][0])
    for i in range(len(widths))], int(cutvec[p+1][0]))
  for p in range(npatterns)
    if cutvec[p+1][0] > 0
]
# Create plot of solution
cuttingPlot(roll_width, widths, summary, solution)
```

### QuanDec

Server side

- AMPL model and data
- Standard AMPL-solver installations

#### Client side

- Interactive tool for collaboration & decision-making
- Runs on any recent web browser
- Java-based implementation
  - \* AMPL API for Java
  - \* Eclipse Remote Application Platform
    - ... developed / supported by Cassotis Consulting

#### **Getting started**

step 1: install QuanDec on a server

step 2: copy & paste your model files (.mod and .dat) into QuanDec's workspace

step 3: create AMPL tables and link them to QuanDec explorer

Fourer, Brandão, Valente, Integrating Optimization Modeling with Programming INFORMS Annual Meeting, Houston, 22-25 October 2017 49

## **QuanDec Availability**

### Ready now for commercial applications

- Free trials available
- Pricing keyed to number of models & users

### First year's support included

- Tailored setup support from Cassotis Consulting
- Customizations possible

#### ... contact sales@ampl.com for details
